

Fork Positioner for Forklift

Fork Positioner for Forklift - The fork positioner is actually a hydraulic apparatus that allows the the one driving to work the lift truck without leaving the seat. They are constructed out of high quality materials and are meant to be able to withstand the most challenging procedures and work environments. Side shifting units have the added ability to laterally position the arms or the entire load in order to facilitate much more accurate carrying and placement in a faster and more efficient manner.

The only one of its kind blade pocket design can enable the person operating it to securely sway the unit's forks without any worry of damaging the positioning cylinders. This allows the worker the choice to either execute simultaneous or independent fork movement, dependent upon the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are needed. Standard OEM carriages could be transformed into fork positioners on existing units.
